Description

MPS / MST

The **MPS** spin-on filter series is a complete product range suitable, for both suction and return applications. Utilising spin-on canisters, the MPS series are quick and easy to service and provide a 'clean' solution when changing elements.

The filter elements are either resin-impregnated paper ($\beta_{x>2}$), glass fibre ($\beta_{x\geq 200}$) or square wire mesh.

The unique filter head is designed for both European CS and American CG standard canister series. One head design series accommodates both styles of elements.

Also available is a new design utilizing a pressure differential visual and electrical indicators - ideal for lubrication applications.

MPS filters are specifically designed for contamination control in hydraulic and lubrication circuits for mobile applications, agricultural and machine tool systems.

The **CW** series of canister removes water from oil while filtering the oil at the same time.

Water absorbent polymers up to 800 times their own weight, provide this major feature.

Water holding capacities: - CW 050 - 240 ml.
CW 150 - 788 ml.

Description

MST - Suitable for installation on return lines, mounted tank top where the flow does not exceed 350 l/min. MST use spin-on canisters incorporating a bypass valve. To avoid oil leaks during maintenance, the canisters have a special anti-drain membrane. **MST** - filter is ideal for machine tool and agricultural applications.

Pressure drop information

General

Pressure drop versus flow rate curve information for both housing and filter elements is in accordance with ISO 3968

Filter assembly pressure drop - $\Delta p_{\text{Total}} = \Delta p_{\text{Housing}} + \Delta p_{\text{Filter element}}$

Housing pressure drop - The housing pressure drop is proportional to the fluid density

Filter element pressure drop - Filter element pressure drop is proportional to kinematic viscosity therefore always check the fluid operating temperature and fluid type to obtain the working viscosity according to the following formula:

$$\Delta p_1 \text{ Filter element} = (\text{working viscosity} / \text{brochure viscosity}) \times \Delta p \text{ filter element}$$

Brochure viscosity 30 mm²/s (cSt)

$$1 \text{ kPa} = 0,01 \text{ bar}$$

Filter assembly sizing example

- Customer requires a 100 l/min filter assembly
- Mineral oil fluid: ISO VG46 (46 mm²/s (cSt) at 40°C)
- 25 micron absolute filtration
- return line application

Selection :

- **Housing pressure drop** - MPS 100/101 with 100 l/min $\Delta p = 0,13 \text{ bar}$ (see curve on page 8)
- **Filter element pressure drop** brochure viscosity - CS 100A25 with 100 l/min $\Delta p = 0,09 \text{ bar}$ (see curve on page 17)
- **Filter element pressure drop** working viscosity - With 46 mm²/s (cSt) $\Delta p_1 = 0,09 \times (46/30) = 0,138 \text{ bar}$
- **Filter assembly pressure drop** $\Delta p_{\text{Total}} = \Delta p_{\text{Housing}} + \Delta p_1 \text{ Filter element} = 0,13 + 0,138 = \mathbf{0,268 \text{ bar}^*}$ { Acceptable pressure drop value, as per our recommendations

Bypass valves pressure drop

The curves were obtained using a mineral oil with a density of 0,86 kg/dm³.
The Δp varies proportionally to the density.

R series: Return filter
S series: Suction filter

SUCTION FILTER

Filter elements - P/M Series

The curves were obtained using a mineral oil with a kinematic viscosity of 30 mm²/s (cSt).
The Δp varies proportionally to the fluid kinematic viscosity.

Filter elements - A Series

The Δp varies proportionally to the fluid kinematic viscosity.

RETURN FILTER

Filter elements - P/M Series

The curves were obtained using a mineral oil with a kinematic viscosity of $30 \text{ mm}^2/\text{s}$ (cSt).
The Δp varies proportionally to the fluid kinematic viscosity.
